

Daz Smith Targets Target tasked by Daz Smith - DST2

Remote viewed by Anita Ikonen - Method EEC

Target 71274310

Today January 26-27, 2019

Start 4:14 AM

## Remote Viewing Target 71274310

by Anita Ikonen

done between January 27 2019 - February 2 2019

### Summary

The target is a container which forms an enclosed space and has an interior space. This container has brown colored exterior walls and two or more light brown colored belts that wrap around its exterior, at least one of these belts has a metal belt buckle on it. These belts are made out of a soft fabric material. The exact shape of the container, whether a rectangular shaped chest or box, or in fact the large exterior hull of a fighter plane sized airplane, was not determined.

Inside the brown container is a red heat source possibly an engine. The red heat source has movement at itself, suggesting possibly moving flames, but that was not certain. A yellow thick fluid material seeps downward into or across the red heat source, possibly coming from the adjacent fuel tank.

One of the main components of the target is the strong air current which is blowing from at the red heat source and vertically straight up. The air is coming from a hole and forms a strong air current which has a strong lifting force in the upward direction.

There is a propeller of white color, it is located directly up above the red heat source at which the air current originates. The exact shape of the propeller was not determined. It was also seen that directly on top of the white propeller is a component made of metal. The propeller rotates continuously around in the horizontal plane (meaning flat instead of standing vertical) and rotates counter clockwise and rather slowly. Along its circular path there are two dips directly opposite one another which cause the rotation to appear wobbled as the propeller makes two dips in its path. The strong air current is directly underneath it and provides with a lifting force which keeps the propeller up where it is. The propeller is located at an elevation above the ground, and the red heat source and the origin of the rising air are located directly below the propeller on the ground level.

A glass window in the shape of an upside down cup or bell shape sits over the contraption so that if you imagine it as an upside down drinking glass the top of it is narrower than the base at the bottom. At the top of this glass cup sits the rotating propeller, and at the base is the ground where you find the red heat source and air source. The glass cup is made out of a material with friction, meaning that if you press your fingers against it your fingers cannot slide across it. The glass window goes around only halfway: if you were to cut it in half along its length, then the side on the left

consists of the glass cup and the side on the right completes the shape and consists of a brown hull.

The brown hull has got three raised ridges that run along its length from bottom upward to top, the ridges taper off as they reach their ends at the top. It reminds me of the underside of a canoe which also have these raised parallel ridges on them. The brown part of the exterior with its raised lighter brown colored ridges, is similar to the brown box with the lighter brown belts, and could be the same element seen from different angles, in any case we are dealing with a brown container with lighter brown raised parts that run along it.

There is a hole somewhere on our device, and the air is escaping from that hole. I have also seen a hole on the brown exterior hull of the device, through which a huge burst of water spewed out with the kind of force you would see from a fire extinguisher hose.

On the right side of the device, which denotes the brown exterior hull side, is a metal wall. When we are standing inside the room, if we want to go to that metal wall, there is not enough space to stand up, the ceiling is low just next to that metal wall. When we are in the main room of our device, on the other side of the metal wall there is electronics. On the floor just behind that metal wall is a fuel tank which is blue color, the fuel has a lower freezing point temperature than water and our device has some precaution built into it to ensure that the fuel in the fuel tank does not freeze into an ice slush or ice, it could be that the red heat source which is just next to it, ensures that the fuel does not freeze. A blue rubber tubing connects to the bottom center of the fuel tank and leads directly to the red heat source. The bottom of the fuel tank was made with sloping down toward the center so that even the last drop of fuel would find its way to the tubing down below.

There is a black sphere or stone which falls down from where the propeller is and straight down toward the ground on our device. The black sphere has also been seen underneath the device in the water. It was also seen inside of the fuel tank. The black sphere starts out falling fast, and ends up resting on a bottom surface where it slowly rolls back and forth in the fluid environment it ends up in.

Since we also have a hole, a hole from which air escapes, and at other times a hole in the exterior hull through which water shoots out, it is suspected that the black sphere might in fact be a bullet or another projectile which shot through our device causing it to have a hole, possibly in the fuel tank itself or otherwise just in the exterior hull of our device, and this hole is suspected of having led our device into some problems.

The ground level which is the elevation at which we find the red heat source and the fuel tank, is a ground that consists of a brown soft wet mud. The muddy ground surrounds all around our device, but very near to the border of the mud is blue water and the blue water is vast, the mud ground is a small region. The area overall is similar to wetlands or coastal area because it is connected to a large water but there is also mud and small islands or small pieces of land around. The main part of our device is in fact embedded in the mud and is found under the ground level under the mud, only a top portion of the device sticks up from the mud. Most of it is under the mud. If we go under the ground level and surface and down, we find that it is not mud all the way across but it quickly

becomes blue water. The water beneath the surface is cold and very dark and something is lurking there.

There is an element which I have not been able to figure out, it often appears to me as the body of a person or animal, I call it manatee in my notes even though it is not that. It seems that there is a man associated with the device, which is why I sometimes feel the living being at this device and see it as the manatee, and at times I am seeing the device as the body of the manatee. It may be that a man and the device are at times fusing into one element. The manatee has two extended brown arms the shape of paddles or airplane wings that are extended to the left and right side. I also see that the manatee has an open mouth (without teeth) and a black serrated wire is threaded through its tongue and air bubbles escape through its mouth and nostrils while water goes into its mouth and nose. This could be the hole on the device and the air escaping from the device, or it could also be the representation of a human body submerged in the water.

The black wire is straight and runs from up to down and is set diagonally instead of perfectly vertical, it has serrated sawtooth edges all along its both sides. It seems to originate at just beneath the propeller up top and to run all the way down to the red heat source. Why it threads through the mouth and tongue of the manatee person I do not know. At one time I saw two such black diagonally set serrated wires starting up top and going down toward the red heat source.

The back end of the manatee body has some fins or tail, which could also be consistent with an airplane. I have not seen legs or feet on the manatee person.

I have seen human activity at the ground level at the mud, a person who was lifting the brown box crate up with its both hands and then setting it back down again. It is also strongly indicated from this target that one person, the manatee person, is watching our device and what is happening. The emotions is always happy from this target.

There is a brass colored metal rock in the shape of a pyramid top which is sitting on the ground level in the mud and is sticking up from the mud, it too is part of a larger structure that is concealed and continues down into the mud, it is the tip of the structure showing up on the surface. This metal pyramid is suspected of being the same element as the metal element that was seen just above on top of the white rotating propeller up above, suggesting that our entire device has started out with the propeller being up above the ground level, and later (or earlier perhaps) ending up sinking down into the mud so that only the top metal part is showing above the mud. There have also been several sightings of the entire device going up versus down in the vertical plane, sinking into or out of the mud, so we have a large structure which seems to end up in the mud and water. However it was clear that the device has an upward moving propulsion due to the air current and the propellers, the device wants to move upward, yet something made it end up downward embedded in the mud.

The person who is walking on the mud ground stumbles on the tip of the brass pyramid with its foot. The person will also be using either a crowbar or a shovel to tilt this tool like a lever against a rock trying to pry a rock out from the mud, this could indicate the person trying to recover our

device from the mud, in case the rock was the same element as the metal brass pyramid.

So what do I think we have. Guessing or speculating or labelling targets is not good protocol because it uses logic. I was unable to reach to a conclusion as to target identity with remote viewing alone. I would guess that what we have is a small brown airplane which got into trouble and sank down tail first vertically aligned into the mud and water.

If any of this seems consistent with the target feedback then you can find all the notes and lots more details (much of it repetitive as I see the same things many times over) in the other text document which has all of the notes.
